Your Comments: The proposed cleanup plan for the willamette superfund site unacceptable. The contaminated area covers more than 2000 acres; the proposed 291 acre dredging area is not good enough. The so-called monitored natural recovery of the site is a neglectful avoidance of the problem. This irresponsible plan consists of waiting for contamination to drift downstream, affecting even more area. If we're going to see any improvement to the site, you must remove at least 1,000 acres of contaminated sediment.

Furthermore, the toxic sediment must be stored in a secure upland landfill, not moved to another area of the river or riparian area. This site needs to be addressed soon, the wildlife and the communities that rely on fish for sustenance cannot wait for 23 years or more. The cleanup must result in a lift to the fish consumption advisory within the next 10-20 years. Please, hold the appropriate entities responsible for the pollution they caused. Make them literally pay for the degradation of the environment and do not bend to the will of corporate polluters.
